

Important Insights (Twitch Users)

- Just Chatting is the dominant category across streamers, viewers, and streams by a wide margin.
- Most viewers are young adults (18-34), located primarily in the US, on free accounts.
- Session durations average ~60 minutes but skew short. Therefore, most people watch briefly.
- A small number of viewers use Twitch a lot, with high numbers in total chat messages sent, bits cheered, and watch time.

Just Chatting has the largest amount of streams by count, followed distantly by FPS, Creative, and Sports. This pattern that is consistent across streamers, viewer preferences, and actual streams.

Important Insights (Viewer Engagement)

- More check ins = more chat messages and more bits cheered.
- Active viewers tend to both follow and subscribe (these behaviors tend to appear together).
- Demographics are not great predictors of attendance.

Check ins, chat messages, and bits cheered form a cluster of strong positive correlations, while demographic variables like age and subscription tier have near zero correlation. Spearman was used because the data is heavily skewed and rank order matters more than raw numeric gaps.

Important Insights (Paid vs. Free Tiers)

- Paid subscribers watch slightly longer per session, reflecting higher viewing intent.
- The top bit cheerers are almost exclusively paid subscribers.
- The 45+ age group sends more chat messages per session than any other group, despite being the smallest group.

Important Insights (Times and Dedication)

- Viewers who chat more or cheer bits are slightly more likely to follow or subscribe, though the effect is modest.
- All timestamps are in one timezone, so mornings and evenings mix viewers from different regions.
 - Local time zones would be better to compare with.
 - This conclusion can not be made.

Without considering time zones, morning sessions durations are the highest bar.
